

$IV \Rightarrow potVal$ (x -axis) $(0, 60)$
 $Result \Rightarrow delayTime$ (y -axis) $(1023, 10,000)$

$$y = mx + c$$

$$y = \left(\frac{10,000 - 60}{1023} \right) x + 60$$

$$y = \frac{9940}{1023} x + 60$$

Hence, we have :

$$DelayTime = \left[\left(\frac{9940}{1023} \right) * potVal \right] + 60 =$$

$dt = ((9940 / 1023) * potVal) + 60$
